AMENDMENT TO THE ABSTRACT

~~It is sought to provide a~~ A spool valve arrangement, which can solve ~~such~~ the problem ~~as~~ of leaks of a pressure medium which may occur ~~in the case~~ as a result of using synthetic resin for forming various spool valve component parts, can be manufactured at low cost, ~~is richly~~ and still be durable and readily permits spool valve operation rate increase. A cylinder is fitted ~~by~~ with a clearance fit in a cylinder bore in a housing of the spool valve arrangement. The housing has first pressure medium ports and the cylinder has second pressure medium ports. ~~Each~~ A socket is inserted through each first pressure medium port in the housing and each second pressure medium port in the cylinder. The socket has a small diameter part, which is fitted ~~by~~ with a clearance fit in the second pressure medium port, and a large diameter part, which is engaged with a shoulder formed in the first pressure medium port. By screwing a conduit end in the first pressure medium port, the socket is held in the mounted position, thus providing a seal of the region of this port and also providing an anti-rotation effect on the cylinder relative to the housing.
